#### **4.3.6 Requirements Not Included in Functionality Tests**

As directed by the Commission the following activities are not in the requirements for the Functionality Tests:

- Manual entry of LSRs, except for Resale LSRs through LEX. (Note that manual activities to resolve problems with LSRs are within scope for the Functionality Test, but out of scope for the Capacity Test.)
- The Mutual Compensation Carrier Bills (i.e., including reciprocal compensation and the summary (9299) records) and the Ancillary Services Billing System (ASBS) Carrier Bills since they do not directly affect the ability of SWB to bill the CLEC
- Unbillable usage
- Detailed LIDB testing. Only the LIDB processing required to support normal test execution of the scenarios is included. Testing will include:
  - Class of service
  - Calling card
  - No collect
  - No collect at customer request.
- Interim Number Portability
- ISDN (as agreed on 3/10/99)
- PBX
- Centrex
- Validating all feature combinations possible; however, the TAG has agreed to the reasonable business/residence combinations while assuring all features are contained within the test coverage
- Feature incompatibilities as agreed to by the TAG
- Error checking (may be on a very limited scale)
- Sub-loop unbundling (manual and requires coordination with ordering CLEC)
- Validation of customer bill (only wholesale/resale bill validation is in scope, since SWB does not provide "customer" bills to the CLECs customer)
- Complex orders (those requiring coordination, more than 5 lines)
- Design services (Note: For purposes of this test, UNE and UNE combinations are not considered design services)
- CLEC hopping (i.e., Resale to Resale Conversion - CLEC Customer converts to another CLEC)
- Directory assistance on UNE-Loops
- Loss notifications
- As agreed in the 3/31/99 TAG meeting, as a result of scenario mapping issues, the outside move functionality will be verified through the business scenarios (i.e., not including the residential scenario) since the process is the same. Therefore, there is no need to find two "friendlies" within the same switch.
- As agreed in the 3/31/99 TAG meeting, as a result of scenario mapping issues, the circular hunting feature will be verified through the business scenarios (i.e., not including the residential scenario) since the process is the same.

#### **4.4.6 Requirements Not Included in Capacity Tests**

The following requirements are not included in the Capacity Test:

- Manual intervention activity or fallout activities. The Capacity Test inputs may be designed to generate errors, but manual activities to resolve errors are beyond the scope of the Capacity Test.
- Stand-alone directory service request orders- the directory listings process does not exercise the EDI Gateway and LEX ordering OSS interfaces and therefore, these types of orders will be excluded. The directory requests will be triggered and validated from the Functionality Test as appropriate.
- Capacity situations relative to major mass moves of customers on a particular day due to limited time offering promotions or the similar situations are beyond the scope of the Capacity Test, as these situations are usually viewed as a stress test. However, implicit in the evaluation of the Capacity Test results will be the ability to demonstrate support for a 100/0 increase in workload and to demonstrate system scalability (i.e., from a perspective of additional capacity on the existing system and the ability to add capacity).
